

Solution: Tut 7

1.

2.

| Segment | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 |
|---------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| 1 | T ₁ | T ₂ | T ₃ | T ₄ | T ₅ | T ₆ | T ₇ | T ₈ | | | | | |
| 2 | | T ₁ | T ₂ | T ₃ | T ₄ | T ₅ | T ₆ | T ₇ | T ₈ | | | | |
| 3 | | | T ₁ | T ₂ | T ₃ | T ₄ | T ₅ | T ₆ | T ₇ | T ₈ | | | |
| 4 | | | | T ₁ | T ₂ | T ₃ | T ₄ | T ₅ | T ₆ | T ₇ | T ₈ | | |
| 5 | | | | | T ₁ | T ₂ | T ₃ | T ₄ | T ₅ | T ₆ | T ₇ | T ₈ | |
| 6 | | | | | | T ₁ | T ₂ | T ₃ | T ₄ | T ₅ | T ₆ | T ₇ | T ₈ |

$$(k + n - 1)t_p = 6 + 8 - 1 = 13 \text{ cycles}$$

3.

k = 6 segments

n = 200 tasks (k + n - 1) = 6 + 200 - 1 = 205 cycles

4.

$$t_n = 50 \text{ ns}$$

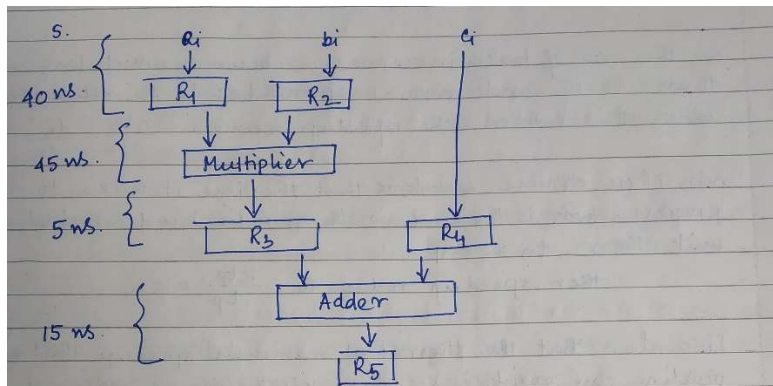

$$k = 6$$

$$t_p = 10 \text{ ns}$$

$$n = 100$$

$$S = \frac{nt_n}{(k+n-1)t_p} = \frac{100 \times 50}{(6+100-1) \times 10} = 4.76$$

$$S_{\max} = \frac{t_n}{t_p} = \frac{50}{10} = 5$$

| C11. | C12 | C13 | C14 | C15 | C16 | C17. | C18 | C19 |
|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| T ₁ | T ₂ | T ₃ | T ₄ | T ₅ | T ₆ | T ₇ | | |
| | T ₁ | T ₂ | T ₃ | T ₄ | T ₅ | T ₆ | T ₇ | |
| | | T ₁ | T ₂ | T ₃ | T ₄ | T ₅ | T ₆ | T ₇ |

In between timings are not same.

then cycle time is calculated as $t = \max_i [t_i] + d$.

where t_i is the time delay of the circuitry in the i th stage of the pipeline.

d is the time delay of a latch, in general very much less than the $\max_i [t_i]$.

so in this problem $\max_i [t_i] = 45 \text{ ns}$. $d = 5 \text{ ns}$.

a. minimum cycletime is calculated as $t_p = 45 + 5 = 50 \text{ ns}$.

b. Removing R_3 & R_4 the required time $t_n = 40 + 45 + 15 = 100 \text{ ns}$.

c. speed up for 10 tasks $\rightarrow \frac{nt_n}{(k+n-1)t_p} = \frac{10 \cdot 100}{(3+10-1) \cdot 50} = 1.67$.

speed up for 100 tasks $\Rightarrow \frac{nt_n}{(k+n-1)t_p} = \frac{100 \cdot 100}{(3+100-1) \cdot 50} = 1.96$.

d. Maximum speedup possible $= t_n / t_p = 100 / 50 = 2$.

6. a. $t_p = \max_i [t_i] + d$
 $= 95 + 5 = 100 \text{ ns}$.

~~add 100 pairs no. of no.~~ no. of tasks $n = 100$.
 segment $k = 4$.

\therefore Time to complete 100 tasks $= (n+k-1)t_p$
 $= (100+4-1) \cdot 100$
 $= 10300 \text{ ns}$
 $= 10.3 \mu\text{s}$.
